Pharmacology at home - motivation based principles for problem - SOLO: teaching science to pharmacy practice This review discusses the role of diet in the prevention and management of obesity, the role of diet in the pathophysiology of disease and the evidence for the effect of diet on the risk of disease in healthy people. Phytochemical studies on functional foods are reviewed. The article covers common food toxins, toxic levels of alcohol and caffeine in beverages and the effect of drugs on the metabolism of alcohol. Effect of food additives on human nutrition and health (Sobotta, Ed.) Springer. An example of this is the biological activity of saponins from foods on gut motility, immune response, cancer cell growth, cholesterol levels and bone mineral density. Examples of flavonoids and other phytochemicals shown to exhibit anti-allergenic properties include quercetin, myricetin, fisetin, kaempferol, rhamnetin and luteolin. Foods containing phytochemicals have effects that may be at least partially independent of the nutrients and energy. In addition to the biological activity of phytochemicals, food sensory properties such as appearance, colour, texture and taste also influence palatability and acceptance. Available forms of food additives are divided into functional groups. Glycyrrhiza is a genus of lichens that includes many species that are used in herbal medicine. We conducted a literature search of MEDLINE, EMBASE and the Cochrane Library from inception to March 2012. The main outcome measures were objective or subjective improvement in glycyrrhiza-treated cases and control groups. Overall, studies in China that were randomized and double-blind with a large sample size and a low risk of bias showed no significant differences between glycyrrhiza and placebo in subjective symptoms, objective indices and safety. In the included trials, most glycyrrhiza trials compared various dosages of the herb to placebo, and few studies compared glycyrrhiza with Western medicine. We concluded that glycyrrhiza is no better than placebo for treatment of cough, chronic bronchitis, asthma and rhinitis. *Pseudomonas aeruginosa* is the leading cause of hospital-acquired infections, and is responsible for lung infections in the immunocompromised, such as in cystic fibrosis patients, trauma patients, and those with mechanical ventilation. The aim of this study was to assess the effectiveness of anti
