I have a class that has a constructor that takes a map as an argument, and inside the constructor, I have a loop that takes a point as a parameter and checks if it is already in the map. This loop is supposed to add the point to the map and then return the map. The problem is that it doesn't add any points to the map and I get no errors. Can anyone tell me why this isn't working? The loop is shown below: `map myMap; while (myMap[100] == 0) { myMap[100] = 5; return myMap; }` A: There are several problems in the while loop (not to mention that `myMap[100]` is out of bounds at this point in the code). `MyMap` is not declared yet. You need to put the code for the constructor in a function: `map make_map(); map myMap = make_map();` This line: `myMap[100] = 5;` should be changed to: `myMap.insert(make_pair(100, 5));`. Why are you using a map as your return type? To me it makes no sense. Just return `myMap`; If `myMap` is a container type, then you will have to write `return new map(myMap);` instead of `return myMap;`. If you don't want to insert the elements into a map when you declare it (as I think you do), then just use a vector `> myVector;` (see [Why should I prefer using `std::vector` over `std::array`?](#)).
