A plea for specific immune adjuvants for mucosal vaccine delivery. For the majority of infectious diseases a vaccine is the most cost-effective intervention available. The development of a cost-effective vaccine has been a long-standing and difficult goal in many areas of public health and medicine, but it has been achieved in areas such as polio, malaria and measles. Unfortunately, no convincing vaccine strategy has been developed for HIV or for tuberculosis and we can assume that this will be true for the future. The search for new adjuvants or delivery systems to enhance the effectiveness of the vaccine is being undertaken by many laboratories. By contrast, no effort has been made to develop vaccines that are effective at the mucosal sites. The only effective vaccines in practice today are the oral vaccines for polio and oral cholera vaccine. The search for new adjuvants for mucosal vaccines is a necessary but often neglected area of research.
