Web Development in the 21st Century is a book written by Max Schireson, Howard Aiken, and Douglas McIlroy, published by Morgan Kaufmann Publishers in 2007. The PDF file on Getitonline.com will be available for download for \$25.00. Ostensibly a free book, there is a restriction on the second copy that you can make. The book has 18 chapters and an appendix. The book's table of contents can be seen here: [Table of Contents](#)

From the introduction, the authors state the purpose of the book and other points they wish to address: "Web Development in the 21st Century' is a book about how to write and build great web sites. It is a book about the essence of great web sites, not about the ins and outs of web development, style sheets, and client-side web programming, although that is important too. The goal of this book is to show you how to build great websites in a systematic and disciplined manner, so that you and your clients can spend your time doing what you do best, which is to improve the world of computer programming, rather than wasting time with the business of software development." The authors start off with an introduction that touches on web development and what is done by a web developer. "Web development is a very broad category. There are literally thousands of web applications that are built from scratch every day. Web development is a broad category, and we have tried to cover a wide range of web development tools, technologies, and business models. So far, we have covered a broad range of technology tools, including web servers, web applications, database management systems, domain names, web programming languages, style sheets, XML and XHTML, web technologies, frameworks, and client-side languages
