The Visual Studio.NET Visualizers are the easiest way to display the contents of managed memory, get data from the program's stack, stack traces, handle unhandled

exceptions, and debug the core of managed applications. With visualizers you can:

- View and handle exceptions with custom status codes and detail messages
- Receive breakpoints, variables, and other objects from the program
- Obtain a snapshot of the program's heap and view its contents
- Monitor the program's performance

The

Visualizers are easy to use. You do not need to know about the internals of the .NET Framework or any other aspect of the Visual Studio .NET tooling. The Visualizers package contains four .NET Visualizers:

- CLR Debugger Visualizer
- Object Browser Visualizer
- Object Inspector Visualizer
- CLR Debugger

Visualizer (64-bit) The DB Connection Manager is a .NET class library that allows database developers to implement database access in a simple way. The DB Connection Manager allows you to develop applications that access relational databases using a simple interface. The DB Connection Manager allows you

to access any type of data that you need from a relational database and use that data directly in your application. It does not require that you know a particular language. It can take care of much of the work of connecting to a database. It hides all of the database access details from the developer. The Windows Web Server 2008 R2
