The present invention relates to a user

interface for presenting media content, and more specifically, to providing access to media content by displaying media content information related to the media content in a manner that is readily understood by a user. Current user interfaces (UIs) for media devices allow a user to access media content. For example, a user can select a particular media file (e.g., play the file) by selecting an entry corresponding to a name of the file from a media directory. If the media file is stored locally on a media device (e.g., a computer), a user can view the file by double clicking the entry. If the file is stored in a remote server accessible to the media device, the file can be viewed by a web browser running on the media device. However, a user interface for a media device is not very useful if the media device is used as a viewing device for media content that is part of another device. For example, a user can view a digital picture slideshow on a display device (e.g., a television (TV)) while viewing a movie on a video device (e.g., a DVD player). The user can view the slideshow and the movie by providing a separate remote control to control the display device and the video device, respectively.
